

QTN on Integrating STEM into Environmental Education Curriculum

Christian Alliance Cheng Wing Gee College

S.3 Biology - Fungiculture

Objectives

- **Environmental Education:**
 1. To appreciate the ecology and biodiversity of fungi as decomposers.
 2. To study the life cycle of mushrooms.
 3. To learn the practice and importance of fungiculture: **Reduction of organic wastes.**
- **STEM:** Coding (BBC micro:bit)

A close-up photograph of several sliced mushrooms, showing their gills and stems, is positioned in the top left corner of the slide.

Schedule

Lesson	Content	Activity
#1	Ecology	Lecture
#2	Biodiversity	Microscope observations
#3	Fungiculture	Coding workshop

A close-up photograph of several sliced mushrooms, showing their gills and stems, is positioned in the bottom right corner of the slide.

Lecture - Ecology & Biodiversity of Fungi

1. Cell biology of fungi
2. Anatomy of mushrooms
3. Life cycle of mushrooms:
Nutrition, Growth & Reproduction
4. Roles of fungi as decomposers

A close-up photograph of a mushroom's gills and stem is visible in the top left corner of the slide.

Coding Workshop - Environmental Factors for Fungiculture

1. Identify an abiotic factor:

Temperature, Light, Humidity & Air Movement

2. Design the experimental and control set-ups

3. Code and take measurements on the factor

4. Measure the growth:

Height, Size of cap & No. of fruiting bodies

A small, out-of-focus photograph of a mushroom is located in the bottom right corner of the slide.

1. Temperature on Growth

Experimental:
Iced water

Control:
Tap water

1. Temperature on Growth

Stimulus (detection): **Temperature**
Response (effect): **LCD + Response lights**

2. Light intensity on Growth

Control:
Indoor lighting

Experimental:
With lamp

2. Light intensity on Growth

Control:
Indoor lighting

Experimental:
With lamp

2. Light intensity on Growth

Stimulus (detection): Light

Response (effect): LCD + Response lights

3. Humidity on Growth

Experimental:
With desiccating agents

Control:
Indoor

3. Humidity (Atmospheric)

Experimental:
With desiccating agents

Control:
Indoor

3. Humidity (Soil)

Experimental:
With desiccating agents

Control:
Indoor

3. Humidity (Soil)

Stimuli (detection): Relative humidity sensor &
Soil moisture sensor
Response (effect): LCD + Response lights

4. Air Movement on Growth

Experimental:
With mini-fans

Control:
Indoor

4. Air Movement on Growth

Stimuli (detection): Nil
Response (effect): 4 mini-fans

A close-up photograph of several sliced mushrooms, showing their gills and stems, is positioned in the top left corner of the slide.

Results & Discussion

- Mushrooms grew better (faster with larger caps, moister) in the control set-ups than in the experimental ones.
 - Low reliability of data.
 - High maintenance/monitoring cost with the current designs.
- 
- A close-up photograph of several sliced mushrooms, showing their gills and stems, is positioned in the bottom right corner of the slide.

A close-up photograph of several sliced mushrooms, showing their gills and stems, is positioned in the top left corner of the slide.

Results & Discussion

- Mushrooms grew better (faster with larger caps, moister) in the control set-ups than in the experimental ones.
More other experimental designs.
 - Low reliability of data.
Increase the sample size.
 - High maintenance/monitoring cost with the current designs.
Automation.
- 
- A close-up photograph of several sliced mushrooms, showing their gills and stems, is positioned in the bottom right corner of the slide.

A close-up photograph of a mushroom's cross-section is visible in the top left corner, showing the gills and the stem.

Looking Forward...

- 4-lesson teaching schedule with all S.3 classes with collaborations with ICT.
 - A field trip to observe fungal species in nature.
 - **Automated systems** to respond to the changes of environmental stimuli.
 - **A fungiculturing lab - Recycling of organic wastes.**
- 
- A close-up photograph of a mushroom's cross-section is visible in the bottom right corner, showing the gills and the stem.
